DECEMBER, 1974

NUMBER 4

*Published by the*

NEBRASKA ORNITHOLOGISTS' UNION, INC.

Founded 1899

## TABLE OF CONTENTS ON BACK COVER

Published quarterly in March, June, September, and December by the Nebraska Ornithologists' Union as its official journal and sent free to all members who are not in arrears for dues. Subscriptions at \$5.00 per volume in the United States, Canada, and Mexico, and \$5.25 in all other countries, payable in advance. Single numbers, \$1.25 each. All dues and subscriptions should be remitted to the Treasurer, Mrs. Sigvald Jensen, Weeping Water, Nebraska 68463. Orders for back numbers should be sent to the Librarian, Dr. Neva Pruess, University of Nebraska State Museum, Lincoln, Nebraska 68508. All manuscripts for publication should be sent to the Editor, R. G. Cortelyou, 5109 Underwood Avenue, Omaha, Nebraska 68132.

## 1974 (FORTY-NINTH) SPRING MIGRATION AND OCCURRENCE REPORT

This report lists 286 species from eleven localities. The count does not include the possible Mississippi Kite from Lincoln County, nor the possibility that one of the individuals reported as just *Empidonax* species might have been a Yellow-bellied Flycatcher. The comparative figures for 1973 are 272 species from twelve localities (Sioux was reported separately rather than being split and combined with Dawes and with Scotts Bluff, but some observations from Box Butte and Sheridan were included with Dawes). On the assumption that the Traill's Flycatchers reported in 1972 and before included both the Willow and the Alder forms, the comparative figures are 274 from ten localities in 1972 and 267 from eleven localities in 1971.

The symbols used in the tabulation are:

Ja, Fe, Mr, Ap, My, and Je for the months

W - to indicate a species which was reported present before 1 January

- S to indicate a species which was reported as remaining after 30 June

X when no exact date in the month was given

P to indicate a species which is present all year, although the same individual birds may not be present during the whole year, and the number of birds present may vary greatly during the year. (W - S indicates much the same thing, but it is used in cases which are considered to be special situations rather than the normal pattern.)

Two dates indicate the first and the last record for the area. The information is presented in a rough west (left) to east (right) order, with areas of about the same longitude presented in a north to south order. The names of the reporters (and of other observers if known) and any special

Meier, and Melba Wigg, Omaha. The count would have been increased had any of the Empidonax sp. individuals been identified as either Yellow-bellied or Alder Flycatchers. The Ross' Geese were seen in flight, almost directly overhead and rather low, flying position 2 and 3 in a V of Snows. The identification was based on the small size (about half that of the Snows) and what seemed to be a faster wing-beat. The Black Duck was seen at Lake Manawa (Iowa) by Mrs. Wigg and Mrs. Meier. The Oldsquaws (two) were seen in Fontenelle Forest on the marsh lake by Mrs. Green and a hiking group. The Sandhill Cranes (six) were seen flying in the Fontenelle Forest area by Mrs. Green and a group of other birders. The Golden Eagle had a slight wing injury and offered no resistance when it was picked up by the Humane Society near Ninety-sixth and Lewis Drive, where it was just sitting in the street. It was turned over to the Games Commission. The lack of resident Chats and Bobolinks was surprising. Upland Sandpipers were seen

more often and in greater numbers than in the past. They apparently nested in a field which normally contains several Bobolink nests. Last year Cerulean Warblers were harder to find than usual, and this year none were reported. The Worm-eating Warbler was seen near Hidden Lake in Fontenelle Forest by Mr. and Mrs. Giblin, foraging in a brush pile. It was recognized by the general buffy color with no markings except for the lines on the head, small size, and long slender bill.

Hall (and Howard) (122), Wood River. Charles Shafer, and Grand Island, Bill Schleicher (reporters). The count would have been increased if any of the Empidonax sp. had been identified as Yellow-bellied, Willow, or Least Flycatchers.

Howard, see above.

Keith (67), Mrs. Jerry Sejkora (reporter) and Don Sejkora, Grant. This report also includes observations on the old bridge road just over the

Lancaster (196), Lincoln, Dr. Esther V. Bennett, Shirley Doole, Jan Faeh (now of Wolbach), Daryl Giblin, Dr. Norma Johnson (reporters), Bryce Anderson. The count would have been greater if the Dowitcher sp. had been identified as a Short-billed Dowitcher, or if any of the Empidonax sp. had been identified as Yellow-bellied or Alder Flycatchers. Some of the observations were made just over the Seward County line, on or near Twin Lakes, part of the Salt Valley group of lakes. Three Sandhill Cranes were seen flying near Twin Lakes, close enough to see the brownish-gray color, long bill, and gliding flight with long neck and long legs outstretched. The

[illegible]

Glaucous Gull was seen the same day at Twin Lakes. It was a second-year bird, all white with a dark-tipped bill, much larger than the Ring-billed Gulls near it (which it was harassing). Its wing-spread was one-third to one-half again as much as that of the Ring-billeds, and its body twice as long and bulky, ruling out the very similar second-year Iceland Gull, which is about Herring Gull size. The Common Gallinule was found dead, washed up on the shore of Branched Oak Lake. It apparently hadn't been dead long, as it was still intact as far as body features and feathers were concerned. Its bright red bill drew attention to the body. A rather tame Smith's Longspur, probably a female, was seen on the dam at Holmes' Lake. The identification was based on about 45 minutes of study, often at 10 feet or less away. It had a general buffy coloration, even on breast and underparts; tail with a little white on the edges of the feathers (not whole white feathers), thus distinguishing it from the females of the other three longspurs; faint white

wingbars and fine streaking on the breast; a walking rather than hopping habit, distinguishing it from the Vesper Sparrow. It had an incomplete facial triangle and dusky orange legs. It tended to stay in the very short grass (about half inch or less) on top of the dam, rather than in the longer grass on the sides. When it flew it would return to this short grass. It would give a series of three to four dry notes when taking off and ascending in its undulating flight. All of the above observations were made by Mr. and Mrs. Giblin. The Prairie Warbler was seen at the Chet Agar Nature Center by Daryl Giblin, and later by Bryce Anderson and a conducted group, and by Mr. and Mrs. Ott. It was recognized by its yellow underparts with black streaking along the sides, olive back with chestnut streaking, peculiar black and yellow facial pattern, and its ascending buzzy trill like a "jerky" Parula Warbler. The White-eyed Vireo was seen and heard at the Chet Agar Nature Center by Daryl Giblin, who recognized its song and its appearance. Dr.

Johnson commented that there was a sharp decrease in Catbirds and Orchard Orioles in her birding area, that Savannah Sparrows seemed a little more plentiful this year, and that three White-throated Sparrows spent the winter in her yard "as always".

Lincoln (144), Hershey, Mrs. Morris A. Cox, and North Platte, Mrs. E. C. Logan for Tout Bird Club (reporters). The count would be higher if the Empidonax sp. had been identified as anything other than a Least Flycatcher. The count does not include a Mississippi Kite, reported to Richard Rosche of Crawford as seen near North Platte this spring by a falconer friend, Bill Niehus of North Platte. The date and other details were not available to the time of this writing. Mr. Rosche saw one at Fort Morgan, Colorado, and understands that there were other sightings in the South Platte valley this year.

McPherson (68), Tryon; Mrs. Oona Bassett (reporter). Mrs. Bassett returned to the ranch 20 May, which accounts for the concentration of first

## NOTES

HAWKS. On 23 March 1974 I saw a Sharp-shinned Hawk and a Goshawk, both near Cozad, Dawson County.

— Daryl Giblin, Lincoln

BALD EAGLE COUNT. On 16 February 1974 the Big Bend Audubon Society made a count of Bald Eagles. The day was 28° to 58°, wind N at 10 to 15 mph, sky conditions clear. One party covered the Platte River from Kearney to Lexington, including Johnson Lake, with stops at all bridges across the river. The westbound trip was on the south side of the river, and the return was on Interstate 80 on the north side, a total of 120 miles. River open, some old snow, Johnson Lake ice-covered with some open water, 44 observers under George W. Brown, (reporter), 8:30 AM to 6 PM. This party saw 56 Bald Eagles, 46 matures and 10 immatures.

POORWILL. Dr. Roger Sharpe reports seeing a Poorwill in the spring of 1974 at the east end of the Pine Ridge, below Norden, Keya Paha County.

[illegible]

MIXED-UP CHICKADEES. Some friends of ours told us that they heard Mountain Chickadees in the picnic and the camping areas in the Wildcat Hills (south of Scotts Bluff), singing. On 18 July 1974 I went there with them with tape recorders and the like. For a whole hour we heard nothing but Black-capped Chickadee call notes. Finally we begun to play the recording and very quickly two chickadees came and began singing Mountain Chickadee songs which to our ears sounded exactly like the recordings as heard on the Peterson series *Western Bird Songs* record. These birds *did not* respond to the Black-capped Chickadee songs! But they all looked like Black-capped Chickadees through the use of binoculars and the unaided eye. We recorded some of their songs and hope to have them analyzed at the Cornell Laboratory. At present I suspect that there is a hybrid population of chickadees in that area - Black-capped x Mountain.

— Richard C. Rosche, Crawford

MORE CITY WOOD DUCKS. Two reports of Wood Ducks nesting in the heart of Omaha have been published previously (*NBR* 40:46 and 42:38), and now a third case, in a different location, has been reported.

Mr. and Mrs. Earnest R. Harmon, who live across Thirtieth Street from the northeast corner of Fort Omaha, saw a Wood Duck and eight ducklings in their yard about 10 June 1974. About a week later Mrs. Harmon heard noise across the street and when she investigated found several ducklings in a flower bed, but didn't see the mother. Over a period of time she found three dead ducklings — one killed by traffic, one by a cat, one by unknown causes. The nearest appreciable body of water is the lagoon in Miller Park, about four blocks away. The Harmons live about 3.5 miles from Memorial Park, near which Wood Duck broods have been seen twice previously.
